Cal Pac Chemical Co., Inc.

A Cleaning Compound for your Needs

CAL FAST

1. **DO NOT** store containers on bare cement. (The cold cement pulls the heat from the solvents through the bottom of container).
2. **DO NOT** agitate with air. (Air breaks the water seal and causes evaporation.)
3. **DO NOT** clean parts with solvent first. Put parts directly into CAL FAST. (Solvent contaminates the carburetor cleaner.)

DESCRIPTION: CAL FAST is a rapid, efficient and completely stable liquid carburetor cleaner designed and perfected to meet the rigid requirements of tune-up men in every type of garage.

CAL FAST IS A TWO-PHASE, NON-FLAMMABLE MATERIAL. Its special rust-preventative seal not only offers protection against rust, but further enhances the excellent rinsing qualities of CAL FAST, as well.

USAGE: Merely disassemble the carburetor to be cleaned, place in a dip basket, and immerse below the seal level of CAL FAST. Most carburetors are cleaned in an average time of 10 to 15 minutes.

Either water or solvent can be used as the method of rinse for carburetors cleaned in CAL FAST. (Many operators prefer to dip the parts up and down once or twice before removal from the cleaning solution, drain carry-out back into the tank of pail, and follow with solvent rinse.

PROVEN ECONOMY: CAL FAST is packaged in 56 gallon ready to use pails, and contains 5 gallons of material. Field tests indicate solution life of CAL FAST is better than competitive materials tested.

Tune-up men working on commission absolutely cannot afford a slow acting, unreliable carburetor cleaner. CAL FAST has, therefore, been built for FAST and DEPENDABLE ACTION.

CAL FAST lasts longer – the addition of water to the seal from time to time prevents the evaporation of active mater, (approx. 1 cup per month, particularly during hot weather), and retains intact the cleaning ability of the product.

REMARKS:

Normal precautions taken with all cleaners of this type should be exercised with the use of CAL FAST. Protection for the skin can be effected with the use of hand lotion or cold creams. Should CAL FAST be splashed into the area of the eyes, flush profusely with water, and call a physician.
